

Sadguru RO Connect

Setup & User Guide for Sadguru Enterprise

Desktop app for RO customer records, 4 / 8 / 12-month service reminders, AI-written festival greetings, and automated WhatsApp messaging. Windows 10 / 11.

In a hurry? You can start using the app for customer records and service reminders **immediately** after installing — no accounts needed. The AI greetings (Section 4) and WhatsApp sending (Section 5) each need a free online account; follow those sections when you are ready.

1. Installing the app

1. Copy `Sadguru RO Connect-Setup-1.1.0.exe` to the shop computer (pen drive, email, or WhatsApp to yourself and download on the PC).
2. Double-click it.
3. **Windows may show a blue screen** saying “Windows protected your PC”. This is normal for new apps that are not from the Microsoft Store. Click **More info**, then **Run anyway**.
4. Choose an install folder (the default is fine) and finish. A **Sadguru RO Connect** icon appears on the desktop.

Portable version: `Sadguru RO Connect-Portable-1.1.0.exe` runs without installing — handy for a second computer or a USB drive.

Where your data is kept

Everything is stored in **one file on this PC** — there is no internet server, no login. The file lives at:

`C:\Users\<your-name>\AppData\Roaming\Sadguru RO Connect\sadguru.db`

Make backups. Open **Settings** → **Data** → **Backup** once a week and save the file to a pen drive or Google Drive. To move to a new PC: install the app there, then **Settings** → **Data** → **Restore** and pick your backup.

2. First run — your customers

1. Open the app. Click **Customers** in the left menu.
2. **Get the template:** click **Sample sheet** and save it. It shows the exact columns the app understands — including a **Customer ID** column for your own numbering (SG-001, etc.).
3. **If you already have an Excel sheet:** click **Import Excel** and choose your `.xlsx` / `.csv` file. A window opens showing your columns with a sample value from each. For every column pick what it is — *Customer ID, Customer name, Phone, City, Product, Serial number, Selling date, Amount, Notes* — or leave it as **Ignore**. Column order does not matter and extra columns are fine. If you map a **Customer ID** column, the app keeps your IDs; otherwise it assigns its own. Tick **“Skip rows whose Customer ID, phone or serial already exists”** to avoid duplicates when re-importing. Then click **Import**.
4. **To add one customer:** click **New entry**, fill the form (put your own number in **Customer ID**, or leave it blank to let the app assign one), then **Save customer**. The app won't let you reuse an ID that already exists.
5. The three service dates (after 4, 8 and 12 months) are calculated for you from the selling date. Tick a service box once it is done.
6. **Export** saves everything back to an Excel file whenever you want.

3. Service reminders

- **Dashboard** shows how many services are **due soon** or **overdue**, plus a chart of the next 6 months.
- **Service Reminders** lists every visit. Use the tabs **Due soon / Overdue / Upcoming / Completed**.
- Change the warning window in **Settings** → **Shop** → **“Remind me this many days before a service”** (default 15).
- **Send / Send all in this list** send a WhatsApp reminder (see Section 5). **Done** marks a service complete.

4. Setting up the AI assistant (festival messages)

This lets the app write a warm, personal greeting for every festival, in English and Gujarati. You need a free “API key” from one AI company. Pick **one**.

Provider	Cost	Best for you
Google Gemini	Free tier is generous	✓ Easiest to start — recommended
Groq	Free	✓ Also very easy, very fast
OpenAI (ChatGPT)	Paid — needs a card, ~₹400 min credit	Optional
Claude (Anthropic)	Paid — needs a card, ~₹400 min credit	Optional

Option A — Google Gemini (recommended)

1. On any browser go to `https://aistudio.google.com/app/apikey`
2. Sign in with a Google account (your normal Gmail is fine).
3. Click **Create API key** → **Create API key in new project**.
4. A long code appears (starts with `AIza...`). Click the copy icon.
5. In the app: **Settings** → **AI assistant**. Set **Provider** = *Google Gemini*.
6. Paste the code into **API key** and click **Save** (next to the box).
7. Click **Test connection**. You should see “*Connection OK*”.
8. Leave **Model** on the default. Choose a **Tone** (Warm is good). Tick the **languages** you want (English, Gujarati).
9. Click **Save changes** at the top right of the Settings page.

Option B — Groq

1. Go to `https://console.groq.com/keys` and sign in (Google login works).
2. Click **Create API Key**, give it any name, **Submit**, then copy the key (starts with `gsk_...`).
3. In the app: **Settings** → **AI assistant**, Provider = *Groq*, paste the key, **Save**, **Test connection**, then **Save changes**.

The other two (OpenAI, Claude) work the same way — their key pages are `platform.openai.com/api-keys` and `console.anthropic.com/settings/keys` — but they ask for a credit/debit card and a small prepaid amount first.

Getting each year's festival dates right (holiday calendar key)

Diwali, Holi, Raksha Bandhan and most festivals fall on a different date every year. Add one free key and the app keeps the dates correct by itself. This is optional — you can also just type the dates each year under **Festival Messages** → **Manage**.

Recommended: Calendarific. Its free plan covers *future* years, which is what you need. API Ninjas' free plan only returns the current year.

Calendarific — get the key

1. On any browser open <https://calendarific.com/signup>.
2. Enter your name, email and a password, and confirm your email if asked.
3. You land on the dashboard at <https://calendarific.com/account>. Copy the **API key** shown there (a long line of letters and numbers).

API Ninjas — get the key (alternative)

1. Open <https://api-ninjas.com/register> and sign up (Google login works).
2. Go to <https://api-ninjas.com/profile> and copy the **API Key** (starts with a short code).
Note: on the free plan it only fills the current year.

Put the key in the app

1. **Settings** → **Festival calendar sync**.
2. Set **Provider** to the one you chose (Calendarific or API Ninjas).
3. Paste the key into the **API key** box and click **Save** (it is stored encrypted on this PC).
4. Click **Test** — you should see “*Holiday API OK*”.
5. Leave “**Keep festival dates updated automatically**” switched **on**.
6. Click **Save changes** at the top right.

What happens now: once a day the app quietly refreshes this year and next year's festival dates and adds any new festivals it finds in the calendar. You can also do it on demand: **Festival Messages** → pick the year → **Sync dates** → review the list → **Apply**. Tick “*also add N new festivals*” to grow the list.

Once at the start of each year: open Festival Messages, choose the new year, click **Sync dates** → **Apply**, then **Generate all** for the messages.

Writing the festival messages

1. Open **Festival Messages**. Pick the **year** at the top right.
2. Click **Generate all for {year}** — the app writes a message for every festival in each language you ticked. This takes about a minute.

3. Click any festival row to open it. Read the message, edit the wording if you like, and click **Save**. Use the **English / ગુજરાતી** tabs to switch language.
4. **{name}** in the text is a placeholder — each customer sees their own name there.
5. Messages are stored in the app, so they keep working even with no internet later.

5. Setting up WhatsApp

This is the longest setup. The app uses the official **WhatsApp Cloud API** from Meta (Facebook). Do it once, calmly, on a computer.

Keep “Dry-run” ON until the very end. While Dry-run is on, the app records every message on the **Activity** screen but sends nothing. This protects you from mistakes.

Step 1 — Create the Meta app

1. Go to `https://developers.facebook.com/` and log in with a Facebook account. (Create a plain Facebook account if you don't have one.)
2. Top-right menu → **My Apps** → **Create App**.
3. Use case: choose **Other** → **Next**. App type: **Business** → **Next**.
4. App name: `Sadguru R0 Connect`. Enter your email. **Create app**.
5. On the app dashboard find **WhatsApp** and click **Set up**.
6. If asked, create or select a **Meta Business Account** (name it “Sadguru Enterprise”).

Step 2 — Get the three values the app needs

Open **WhatsApp** → **API Setup** in the left menu. You will see:

1. **Temporary access token** — a long code. It works for **24 hours** (fine for testing). Copy it.
2. **Phone number ID** — a number under the test phone number. Copy it.
3. A test **“From” number** provided by Meta, and a box to add **“To” numbers** — add your own mobile number here so you can receive the test.

Step 3 — Put them in the app

1. **Settings** → **WhatsApp Cloud API**.
2. **Dry-run** switch: leave it **ON** for now.
3. **Phone number ID**: paste the number from Step 2.
4. **Access token**: paste the temporary token, click **Save** (it is stored encrypted).
5. Click **Save changes** at the top right.
6. In the **Test number** box type your own mobile (10 digits, e.g. `9825012345`) and click **Send test message**. Because Dry-run is on, it only appears on the **Activity** screen as “dry-run”.
7. Now turn **Dry-run OFF**, click **Save changes**, and press **Send test message** again. A WhatsApp message should arrive on your phone within a few seconds.

If it fails, the exact reason from WhatsApp is shown on the **Activity** screen (for example “Invalid OAuth access token” = the token expired — get a fresh one from API Setup).

Step 4 — For everyday use (do this within a day or two)

The temporary token dies after 24 hours and the test number can only message a few saved numbers. To send to all your customers you need two more things:

- **A permanent token.** In the Meta app: **Business Settings** → **Users** → **System users** → add a system user → **Generate token** for your app with the `whatsapp_business_messaging` permission. Paste this token into the app’s **Access token** box and **Save**. It does not expire.
- **A real phone number** added and verified under **WhatsApp** → **API Setup** → **Add phone number** (a number not already on the normal WhatsApp app).
- **Approved message templates.** To message customers who have *not* messaged you first (i.e. reminders and festival greetings), Meta requires a pre-approved template. Under **WhatsApp** → **Message Templates** create one, e.g. name `service_reminder`, category **Utility**, body: `{{1}}` (one variable = the customer’s name). Submit for review — approval is usually a few minutes to a day.
- In the app: **Settings** → **WhatsApp** → put the template name in **Approved template name** and the language code (`en` or `gu`) in **Template language code**, then **Save changes**.

Without an approved template you can still reply to customers who messaged you in the last 24 hours, and all test messages to your own saved numbers work.

6. Everyday use

Service reminders

1. Open **Service Reminders**, tab **Due soon**.
2. Check each message preview, then **Send** per customer or **Send all in this list**.
3. After the visit, click **Done**.

Festival greetings

- Turn on **Settings** → **(festival panel)** → “**Send automatically at 9:00 AM**” — the app will send each festival’s greeting to every customer on the day, by itself, as long as the computer is on.
- If the PC was off on the festival day, **Festival Messages** shows a “**missed festival greetings**” box with a **Send now** button.
- You can also open any festival and press **Send now** manually.

Activity screen

Every message the app sent (or logged in dry-run) is listed here with its status — **sent**, **failed** (with the reason), or **dry-run**. Check it after any bulk send.

7. Troubleshooting

What you see	What to do
“Windows protected your PC” on install	Click More info → Run anyway . It is safe; the warning is only because the app is new and not code-signed.
Festival page says “No AI provider is configured”	Finish Section 4 — provider, key, Save , then Save changes .
“Test connection” fails	The key was mistyped or the account has no free quota left. Create a fresh key.
WhatsApp says “Invalid OAuth access token”	The token expired. Get a new one from WhatsApp → API Setup , or set up the permanent token (Section 5, Step 4).
Message “sent” but not delivered	The customer’s number isn’t on your test list, or you need an approved template for that number. See Section 5, Step 4.
Moving to a new computer	Backup on the old PC (Settings → Data → Backup), install the app on the new PC, then Restore and pick the backup file.

App won't open / data looks wrong	Use Settings → Data → Restore with your latest backup.
-----------------------------------	---

8. Quick reference

Setting	Where
Reminder lead time	Settings → Shop
AI provider & key	Settings → AI assistant
Festival languages / tone	Settings → AI assistant
Holiday API key (auto festival dates)	Settings → Festival calendar sync
Edit / add / remove festivals	Festival Messages → Manage
Fetch this year's festival dates	Festival Messages → Sync dates
Auto-send festival greetings at 9 AM	Festival Messages page (left panel switch)
WhatsApp number ID & token	Settings → WhatsApp Cloud API
Dry-run (safe mode) on/off	Settings → WhatsApp Cloud API
Backup / Restore database	Settings → Data
Light / Dark screen	Sun / moon button, top right
